FINDING SYSTEM AND DEVICE FOR CARRYING OUT SAID METHOD

(57) Abstract: A position-finding method in a radiocommunication system comprising at least one first and one second sub-system and means (34, 35, 36, 39) for finding the position of a mobile terminal (30), wherein the mobile system can communicate and carry out measurements relating to position-finding on each of the first and second sub-systems, and the position finding means for locating the mobile terminal are embodied in such a way that they can take into account certain measurements carried out by the mobile terminal. The inventive method comprises the following steps when the mobile terminal is connected to the first sub-system: measurements relating to position finding on the second sub-system are carried out in the mobile terminal; the measurements thus carried out are transmitted to the first sub-system; and carrying out the measurements in order to find the position of the mobile terminal by taking into account certain measurements, at least those transmitted to the first sub-system.
